

# ARDEA

- The adaptable speargun for rough, changing ocean conditions.

*MSc04 ID 04*

Ardea is an adaptable speargun designed by 4th semester master thesis students; Anders Poulsen, Anne Hjortflod Nielsen and Peter Sørensen.

The speargun is designed specially for Danish spearfishers, who experience rough and changing ocean conditions in Denmark while spearfishing. Unlike any other spearguns Ardea can be adjusted in length to accommodate the different needs coming from the changing conditions and visibility of the ocean.

Another quality of Ardea is the new way of loading the speargun. Now the spearfisher will do the loading by stretching out his legs instead of using the fairly limited strength in his arms as the existing does.

Ardea is the optimal choice of speargun for ocean conditions, where the visibility is low and changing. Ardea is also a speargun perfect for the spearfisher, who wants to hunt fish in different surroundings, where Ardea's ability to change and adapt will be indispensable.
